

Johne's Testing

The CIS Johne's Monitoring Services provides testing of your cattle to help manage the potential disease affecting your current and future herd.

Johne's is a chronic progressive intestinal disease caused by the infection with *Mycobacterium avium* subspecies paratuberculosis (MAP). Johne's disease has a significant impact on the technical performance of the cow, affecting productivity and fertility.

CIS CHeCS monitoring service for Johnes includes:-

- CIS CHeCS monitoring service for generating results
- Vet support to oversee results
- Web page to review results and Vet comments against the herd or individual animals
- Quarterly whole herd testing service
- Access results through CIS Your Herd
